

KlevaKlip – Adhesive System Explanation

Adhesives when used with ModWood and KlevaKlip:

The ModWood Natural Grain Collection boards have a groove along the side to accommodate the “teeth” of the KlevaKlip. This gives the board excellent holding power within the clip, even without the use of adhesive.

The addition of adhesive however, serves to:

- Give some assistance to holding power of the clip
- Prevents any lateral movement of the board in the clip – other than the normal expansion/contraction of the board
- Prevents any possibility of board rattle in the clip
- Provides a very stable base for the board to sit in the clip
- Helps to provide a very soft, quiet feel for someone walking on the deck
